Eric Hall
Founder & Chief Innovative Officer

A commercial architect-turned-construction superintendent-turned-software architect, Hall is the brain trust behind our flagship building intelligence platform. In 2010, he conceived a technology platform that would improve accuracy and efficiency during the construction process, and over the years has evolved the system into an advanced cloud and mobile solution that combines building information modeling, facilities maintenance and management, and the latest sensor and IoT technologies. That solution, Site 1001, is now the most advanced smart building platform on the market.

Hall is a frequent speaker on the subjects of smart cities, building evolution, the Internet of Things, and how technology adoption and automation can improve traditionally "non-technical" industries such as construction, government and infrastructure.
